Attachment A
Process Description

ConAgra Foods, Inc. (ConAgra) currently operates a turkey processing plant located at 307 Dodgen Place in the city of Ozark (Franklin County), Arkansas. Live turkeys are slaughtered, cleaned and dressed, and packaged for commercial distribution at the facility. The production operations at the ConAgra plant are properly categorized using Standard Industrial Classification Code 2015 (poultry processing).

The turkey processing operations are performed as follows: Live birds are received via truck and stored in outdoor holding/cooling sheds pending processing. The turkeys are subsequently moved inside the plant and slaughtered. The birds are then scalded with a stream of hot water to facilitate plucking. The feathers are subsequently removed using automated "picking" machines. The plucked turkeys are then eviscerated and cleaned. The dressed birds are subsequently chilled in a water bath. The turkeys are then transferred to a packaging area where the whole birds are graded, bagged and boxed. The packaged turkeys are then frozen. The finished poultry products are subsequently stored in a meat locker pending shipment to customers in refrigerated trucks. The turkeys are moved through the processing operations via a hanging conveyor system. The waste by-products (i.e., feathers, viscera, etc.) are collected and stored indoors pending shipment to a rendering plant.

Wastewater is generated during the turkey processing operations. The primary sources include the scalding and chilling equipment, washing of the birds during evisceration and dressing, and clean-up of the plant machinery and facilities. The raw wastewater is conveyed to an on-site wastewater treatment plant (WWTP) for processing. The influent stream is first subjected to primary and secondary screening to remove large solid materials. The captured solids are subsequently shipped off-site to a rendering plant. Next, the wastewater is transferred to dissolved air flotation (DAF) cells for pretreatment. Additional solids are removed in this equipment via chemical coagulation, flocculation and flotation. Three DAF cells are operated in parallel. Initial reductions in biochemical oxygen demand (BOD), total suspended solids (TSS) and other wastewater constituents are achieved during the DAF process. The pretreated wastewater is then subjected to secondary biological treatment, whereas the DAF sludge is conditioned for disposal via land application. Conditioning of the sludge is accomplished using a flotation thickener. The material is then stored in an aerated tank. The waste DAF sludge is later transported off-site in tank trucks by a Terra Renewal Services, Inc., permitted hauler. The

sludge is subsequently disposed of via subsurface injection on agricultural land. The following sites and permits held by Terra Renewal Services, Inc. can receive wasted sludge from ConAgra:

- Crawford County, AFIN – 17-00294, Permit No. 4741-WR-2
- Franklin County, AFIN – 24-00268, Permit No. 4742-WR-1
- Logan County, AFIN – 42-00244, Permit No. 4823-W

The pretreated wastewater from the DAF cells is subjected to secondary treatment using a complete-mix activated sludge (CMAS) system. Final reductions in effluent BOD, ammonia and other pollutants are achieved using this equipment. The treated wastewater then flows to a gravity clarifier for removal of TSS. The effluent is subsequently disinfected using ultraviolet (UV) light. The final WWTP effluent is then discharged to the Arkansas River at Outfall 001. Approximately 1.10 million gallons/day of process wastewater are generated. (The waste activated sludge from the CMAS unit is processed along with the DAF sludge. The combined stream is thickened in preparation for land application.)

The Ozark plant features a natural gas-fired boiler for generating steam and hot water for the turkey processing operations. A water softener is operated in conjunction with this equipment. The boiler blowdown and softener backwash are discharged to the plant sewer system. These streams commingle with the process wastewater and are treated in the WWTP. Approximately 5,000 gallons/day of boiler blowdown and softener backwash combined are generated. (The Ozark facility has a segregated collection system for domestic wastewater. This stream is generated in the plant restrooms, locker rooms, shop sinks, etc. The sanitary sewage is discharged to the city of Ozark's wastewater collection and treatment system.)

There is a potential for the storm water runoff from the area around the turkey holding/cooling sheds and the truck wash station to become contaminated with poultry waste, oil and grease, and solids. Approximately 5,000 gallons/day of wash water are generated at the truck wash station. The station is located next to the cooling shed area. Poultry trailers are cleaned using this equipment. The discharge from the truck wash will be screened prior to its release to remove large solid materials. The captured solids will subsequently be shipped off-site to a rendering plant. In the summer, water is sprayed on the cooling sheds to keep the turkeys

cool. This sprayed water along with the truck wash down water, and storm water runoff from these areas is collected and pumped to the WWTP. The collected runoff is treated in the WWTP with the process water from the turkey processing operations and discharge to Outfall 001.

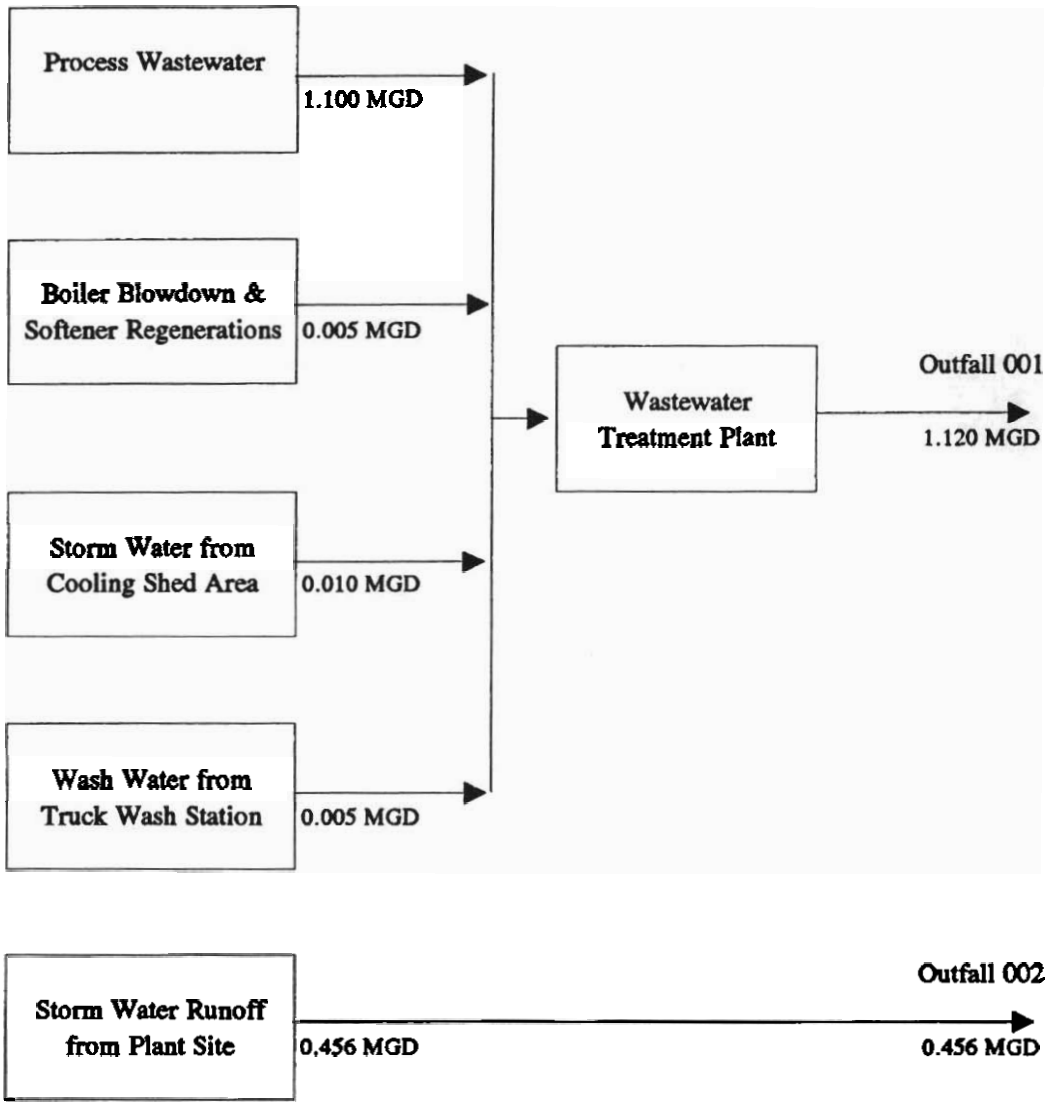

Storm water runoff associated with industrial activities is also generated in other areas at the Ozark facility. This runoff occurs primarily at the truck parking and refueling areas, a roll-off box for trash storage, and several miscellaneous sources. The runoff is routed through a variety of aboveground and underground conveyances to a common pumping station. The storm water is subsequently pumped directly into the Arkansas River at Outfall 002. (An earthen levee separates the ConAgra facility from the floodplain of the river. During precipitation events, the storm water accumulates within a grassy swale which runs along the interior of the flood wall. The levee was built and is maintained by the U.S. Army Corps of Engineers.)

ConAgra currently operates under the authority of individual NPDES Permit No. AR0048267. Said permit authorizes the discharge of treated process wastewater and boiler blowdown at Outfall 001. Storm water runoff from the Ozark facility is discharged to the Arkansas River at Outfalls 001 and 002.

ConAgra's existing wastewater discharge permit coverage will expire on July 31, 2006. The enclosed permit application is submitted to renew this permit coverage. The permittee requests that its NPDES permit be revoked and reissued for a full five-year term.

A water flow diagram for the ConAgra facility is provided herein as Attachment B. A topographic map and plot plan for the Ozark plant are presented as Attachment C. Information on the land application of wastewater sludge is provided in Attachment E. Discharge Monitoring Reports and analytical results are presented in Attachment F.

Attachment B - Water Flow Diagram
ConAgra Foods, Inc. – Ozark, Arkansas

MGD = Million gallons per day

STORM WATER GENERAL PERMIT
ADDITIONAL MONITORING REQUIREMENTS

The following monitoring requirements shall be in addition to those on the Discharge Monitoring Report (DMR):

OUTFALL NUMBER 001

DATE OF STORM EVENT SAMPLED: 10/31/05

DURATION OF EVENT: 2 hours

ESTIMATE OF RAINFALL EVENT: 1 inches

TIME SINCE LAST MEASURABLE EVENT (i.e., >0.1 in.): 12 days

ESTIMATE OF TOTAL VOLUME DISCHARGED: 100,000 gallons

By signature below, I certify that I have read and understand the conditions of the certification on the DMR form and described in further detail in Part VI.I of the general storm water permit. Furthermore, I believe that the information submitted in these additional monitoring requirements meets all conditions of such certification.
